

Activity: What Was Missed

1. What signs were missed?

(List at least three indicators of compromise or behavioral anomalies.)

- multiple failed login attempts
- This was late at night: 23:47
- Antivirus alert - Suspicious Powershell behavior detected- action ignored at 02:14

2. At what stage of the exploit lifecycle did these indicators appear?

(e.g., delivery, execution, persistence, exfiltration)

- These indicators appeared after vulnerability had already been discovered in the Exploit Code Developed phase

3. What could have been done differently to detect or prevent the breach sooner?

(Consider logging, alert response, access controls, or user training.)

- To have prevented this, there might have been better employee security training, least privilege/role based access implemented, not ignoring alerts from system, and network segmentation(no reason for the marketing team to be connected to sensitive client data).
- Better log analysis, or alert prioritization could have mitigated damage. This did happen late at night, but not ignoring the alerts might have allowed security personnel to close ports, or disable functions, not allowing the attacker to glean any data.
