

Activity: Mapping Attack Methods to Surfaces (optional)

1. Review the list of attack methods provided.

2. For each method, match it to the attack surface it typically targets:

- **Network**
- **System**
- **Physical**
- **Human**

3. Provide a short explanation of how the method works or how it exploits the surface.

-Phishing is fake emails, messages, or websites designed to trick users into clicking links, sharing passwords, or downloading malware. It typically targets human attack surfaces, as it is a form of social engineering.

-Malware is malicious software like viruses, spyware, or ransomware that can infect a system and cause harm. It spreads through email attachments, infected downloads, or compromised USB drives. Think ransomware that locks you out of your system and demands payment. This attacks the system attack surface.

-Drive-by downloads are infections that occur just by visiting a compromised or malicious website - no clicks required. It exploits vulnerabilities in your browser or plugins to silently install malware. Affects network attack surface.

-Physical breaches are unauthorized physical access to systems or facilities through tailgating, or through stolen, or lost devices. This targets the physical attack surface.
