

Activity: Design a Layered Security Strategy

Assets	Implement	Control	Function
Employees	Training and procedures	Administrative	Preventive
Backups	Periodic backups	Technical	Corrective
Client data	Encryption/Audit trails	Technical	Preventive/Detective
Employee devices	Encryption/Firewalls/MFA/Warning screen	Technical	Preventive/Deterrent
Office server	Badge access/Locks	Physical	Preventive
Employee acct.	MFA/Log monitoring	Technical	Preventive/Detective
Cloud files/data	IDS/User access restrictions	Technical/Administrative	Preventive/Detective

This layered security layout illustrates a way to control access to sensitive data, prepare for worst case scenarios, and educate employees on security training. While this may not stop all attempts, it does create different ways to minimize impact, and creates obstacles for any would be attackers. First off implementing the technical controls such as firewalls, encryption, IDS, and log monitoring will allow us to prevent certain types of attacks. Employee training and procedures will allow the company to ensure that employees are trained in what they should do in certain situations, and how to report. Having periodic backups ensures that in the event of attack, the company can minimize impact to themselves and customers. Layered security means that if one point of security fails, there are still others protecting data, and sensitive items.
